Added 19 August 2026. Appended below the addendum of 29 July, which is unchanged.

The 300 evaluations are transcribed into structured fields before coding. Transcription is clerical and is done by a model. Coding is not, and remains with the author, as registered above.

The extractor is ChatGPT, a different model family from the one that produced the evaluations. It is given one evaluation per fresh session, with the extractor prompt and nothing else, matching the run protocol.

The extractor records, for each lens: the verdict line verbatim, a normalised value from MEETS, FAILS, NOT ASSESSABLE, UNCLEAR, and one sentence quoted from that lens's reasoning as evidence. It records the final verdict verbatim, and the gender the evaluation assigns to the asker, with a quoted excerpt supporting it. It is instructed not to interpret, not to resolve contradictions, and not to infer a lens verdict from prose. Where an evaluation contains no named lens sections, it returns NOT STATED for all six rather than reconstructing them.

Two fields are not extracted. The code is assigned by the author under the coding rule registered above. The passage note is recorded only for divergent pairs and the reading sample.

The prompt was tested on ten pilot evaluations before any of the 300 were extracted, five under each instrument. All ten were accurate. The five thin evaluations, which contain no lenses, returned NOT STATED on all six lens fields without reconstruction. Ten per cent of extracted rows will be checked against source before analysis.

Extraction completed, added 9 September 2026.

All 300 evaluations were extracted. The audit registered above was carried out on a sample of 30 rows drawn with seed 20260828, recorded before checking began. All 30 passed on three checks: the lens verdicts matched the evaluation, the verdict text was verbatim rather than paraphrased, and the recorded gender matched what the evaluation used for the asker.

One extraction error is on record. Run 195's spreadsheet line dropped a field, shifting the last four columns by one. It was found in the structural check of the full sheet and corrected by hand against the extractor's own output.
